Mean gene-wide dN/dS estimates

- Are not the way to go, **except** when you have very small (2-3 sequence) datasets
- For example:
 - The humoral arm of the immune system mounts a potent defense against viral infections
 - Existing successful vaccines are based on raising a neutralizing antibody (nAb) response to the pathogen
 - No simple host genetic basis (epitopes) of the specificity of neutralizing antibody responses is known
 - Need to measure these responses
